OVERVIEW. This program will cover the practical applications of the modern distributed control systems (DCS). Whilst all control systems are distributed to a certain extent today and there is a definite merging of the concepts of DCS, Programmable Logic Controller (PLC) and SCADA and despite the rapid growth in the use of PLCs and SCADA systems, some of the advantages of a DCS can still be said to be: Integrity: The expected process down-time caused by a conventional DCS is significantly ...

but there is no central operator supervisory control. This is in contrast to systems that use centralized controllers; either discrete controllers located at a central control room or within a central computer. The DCS concept increases reliability and reduces installation costs by localising control functions

Distributed control systems (DCSs) are computer-software packages communicating with control hardware and providing a centralized human-machine interface (HMI) for controlled equipment. 1 Programmable logic controllers (PLCs) form the core of DCSs and other computer control systems. These replace hard-wired relay circuits and allow easy programming and reprogramming; easy diagnostics and repair; and communicating with central data collection systems feeding a DCS.

What is a Distributed Control System Distributed Control System is a specially designed control system used to control complex, large, and geographically distributed applications in industrial processes. In this, controllers are distributed throughout the entire plant area.

Distributed Control System - Basic Elements & Features of DCS

A distributed control system (DCS) is used to control production systems within the same geographic location. It usually involves a computer that communicates with control elements distributed throughout the plant or process, e.g. machine or process controllers and PLCs, through a bus or directly and displays gathered data.

Engineering time: A small SCADA/PLC system is easy to design and configure. As the system grows bigger, the effort involved to properly design and configure the system grows exponentially, and also the risks that things can go wrong. To design and implement a single loop PID controller in a SCADA/PLC is easy and quick.
